

Giraffe and the Little Turn

A story about a little pause.

wondermaths.app

At the savanna post office, a little cart gave a squeak. Giraffe lifted her head. That was the cart for the building corner, where everyone was waiting to make a bridge. But its trays could not leave until their number labels matched the blocks inside. “I want to get these labels ready myself. Then our blocks can go and become a bridge!”

Elephant set a wooden holder on the table. Its number tiles could trade places, but they stayed right side up. One gentle turn, one little click. Beside it waited a green checking button. Elephant rested his trunk on the table and settled in. “The cart can wait. There's room for a little thinking.”

Giraffe counted the first tray. Three long rods, with ten blocks in each. Ten, twenty, thirty. Then seven single blocks. Thirty-seven. She found a three and a seven on the label. Her hoof hovered over the tiles. The seven looked very important. “The bigger digit can go first. Seven, then three. Both the right digits. Ready!”

She pressed the checking button. Not a ready label yet. The label said seventy-three: seven tens and three ones. The tray still held three tens and seven ones. No blocks had jumped in. No blocks had jumped out. Giraffe tilted her head.

“Maybe it needs a really good turn. I'll swap their places, then swap them back!” The tiles traded places. Click. Thirty-seven. Before checking, Giraffe turned them back again. Click. Seventy-three. She pressed the button, but the same mismatch was waiting. The cart gave its small squeak. Elephant stayed beside her. Nobody hurried her hoof.

“Two turns, and I'm right back where I started. My label is very busy going nowhere.” Giraffe set her hoof down. The holder went quiet. In that little quiet, she noticed something: she had checked the digits, but not what each digit was counting. She tried a new plan, saying it softly to herself. “Pause. Check. Choose.”

First, Giraffe checked the tens. The tray had three rods. Her label's seven was counting seven tens. That was the part that did not fit. She did not need more blocks, and she did not need faster turns. She needed to give the three the tens place. “Pause. Check. Choose. Three goes in the tens place. Seven goes in the ones place. One turn will do it.”

Giraffe turned the tiles once and left them there. Now the label said thirty-seven. Three tens. Seven ones. She compared it with the tray, then pressed the green checking button. This time the label was ready. The blocks could go to the building corner. “The blocks were fine all along! I just had the right digits doing the wrong jobs.”

Elephant slid the next tray closer. Four tens and four ones: forty-four. Its label already said forty-four. Giraffe reached for the holder. The little click was rather satisfying. She nearly gave it a turn just to hear it again. Then her hoof stopped. “Pause. Check. Choose. Four tens, four ones. This label already fits. If I swap the fours, it will still say forty-four. I can leave it alone.”

She pressed the checking button. Ready. No turn at all. The quietest label was ready too! Giraffe tucked both checked labels beside their trays. Elephant steadied the cart, but left the last part to her. “Would you check the labels with me next time? I could use a partner who notices the little things.” “I'd like that. And we won't have to turn every label just to make it feel useful.”

Giraffe touched her hoof to Elephant's trunk. Together, they rolled the cart toward the building corner. Its little wheel squeaked again. That was the sound Giraffe had been waiting for. Not a busy holder. Blocks on their way to becoming a bridge. And she had helped them get there.

A little pause.
A thoughtful choice.

Ori says:

Little one, when something doesn't fit, pause and check one part at a time. Then you can choose what to change.
